Salifort Motors Employee Turnover Analysis

Google Advanced Data Analytics Capstone

Project Overview

This project analyzes employee survey data from Salifort Motors to identify the main reasons behind high employee turnover. The goal is to find key factors that contribute to employees leaving and build a predictive machine learning model to help the company reduce turnover, save costs, and improve employee satisfaction and retention.

Details

Python, Pandas, Scikit-learn used for EDA and model building. Random Forest model selected for best performance.

Key Insights

- Employees with low satisfaction are most likely to leave
- Overworked employees with too many projects show high turnover.
- Low salary and no promotion increases risk of leaving.
- Satisfaction level, working hours, and number of projects are top predictors of turnover

Next Steps

- Share findings with HR and leadership
- Reduce overwork and improve satisfaction
- Offer more promotions and salary growth
- Monitor at-risk employees using the model

Salifort Motors Employee Turnover Analysis

Google Advanced Data Analytics Capstone

ISSUE / PROBLEM

High employee turnover is increasing hiring and training costs and reducing overall productivity at Salifort Motors.

RESPONSE

Used Python to perform EDA, hypothesis testing, and built machine learning models (Logistic Regression, Decision Tree, Random Forest) to predict which employees are likely to leave.

IMPACT

The model helps HR identify at-risk employees early, reduce hiring costs, improve satisfaction, and make better retention decisions.

KEY INSIGHTS

- Employees with low satisfaction scores are most likely to leave
- Overworked employees (high hours + many projects) show high turnover
- Employees with no promotion and low salary leave more often
- Satisfaction level, monthly hours, and number of projects are top predictors

Salifort Motors Employee Turnover Analysis

Google Advanced Data Analytics Capstone

➤ ISSUE / PROBLEM

High employee turnover is costing Salifort Motors significantly in hiring and training. The company needed a data-driven solution to understand and predict employee turnover.

➤ IMPACT

HR can now identify at-risk employees early and take action to improve retention and reduce costs.

➤ RESPONSE

Python was used to analyze HR data, perform EDA, and build machine learning models. Random Forest model was selected for best performance with 98% accuracy.

➤ KEY INSIGHTS

- Satisfaction level is the strongest predictor
- Overworked employees leave more often
- Low salary and no promotion increase turnover risk

Salifort Motors Employee Turnover Analysis

Google Advanced Data Analytics Capstone

OVERVIEW

This project analyzed employee survey data from Salifort Motors to identify key factors causing high turnover and built a predictive model to help HR take preventive action.

PROJECT STATUS

- Data collected and cleaned. EDA and visualizations completed.
- Hypothesis testing done. Machine learning models built.
- Random Forest selected as final model.
- Executive summary prepared

NEXT STEPS

- Share findings with HR and leadership
- Reduce employee overwork
- Offer promotions and salary growth
- Monitor at-risk employees using model

KEY INSIGHTS

- Satisfaction level is top predictor
- Overworked employees leave more
- Low salary increases turnover risk
- Random Forest achieved 98% accuracy

Salifort Motors Employee Turnover Analysis

Google Advanced Data Analytics Capstone

Overview

Salifort Motors collected employee survey data to understand why employees are leaving. A data analytics approach was used to find patterns and build a predictive model.

Problem

High employee turnover is increasing costs and reducing productivity. The company lacks insight into which employees are at risk of leaving.

Solution

Python was used to clean data, perform EDA, and build a Random Forest model achieving 98% accuracy to predict employee turnover

Details

Dataset: 14,999 employee records with 10 variables. After cleaning, 11,991 records were used. Key variables include satisfaction level, monthly hours, number of projects, tenure, and salary.

Next Steps

- Implement model in HR system
- Focus on low satisfaction employees
- Improve work life balance policies
- Regular monitoring of at-risk employees

Salifort Motors Employee Turnover Analysis

Google Advanced Data Analytics Capstone

Overview

This project analyzed HR data from Salifort Motors to understand employee turnover patterns and build a machine learning model to predict which employees are likely to leave.

Objective

To identify the main factors causing employee turnover and build a predictive model that helps HR department take early action to improve employee retention and reduce costs .

Results

- Logistic Regression: 83% accuracy, 17% recall
 - Random Forest: 98% accuracy, 89% recall
 - Random Forest selected as final model
 - Top factors: satisfaction level, tenure, monthly hours, number of projects
 - Employees with low satisfaction and high workload are most at risk
-

Next Steps

- Share results with HR and leadership
 - Use model to monitor at-risk employees
 - Improve satisfaction and reduce overwork
 - Offer better promotions and salary growth
-
